## # Debugging Sandwich variance Estimator of DR ATE Estimator #

## -- 11월 11일 Version

(What To Do)

1) 
$$\int_{N} \cdot J(\theta^{*}) \cdot (\hat{\theta} - \theta^{*}) = \frac{1}{\sqrt{N}} \stackrel{N}{\rightleftharpoons} \psi_{T}(\theta^{*})$$

$$= \frac{1}{\sqrt{N}} \cdot J(\theta^{*})^{-1} \cdot \stackrel{N}{\rightleftharpoons} \psi_{T}(\theta^{*})$$

$$= \int_{N} \cdot J(\theta^{*})^{-1} \left( \frac{1}{N} \stackrel{N}{\rightleftharpoons} \psi_{T}(\theta^{*}) \right)$$

$$= \frac{1}{\sqrt{N}} \cdot J(\theta^{*})^{-1} \left( \frac{1}{N} \stackrel{N}{\rightleftharpoons} \psi_{T}(\theta^{*}) \right)$$

$$= \frac{1}{\sqrt{N}} \cdot J(\theta^{*})^{-1} \left( \frac{1}{N} \stackrel{N}{\rightleftharpoons} \psi_{T}(\theta^{*}) \right)$$

$$= \frac{1}{\sqrt{N}} \cdot J(\theta^{*})^{-1} \cdot J(\theta^{*})^{-1} \cdot J(\theta^{*})$$

$$= \frac{1}{\sqrt{N}} \cdot J(\theta^{*})^{-1}$$

Monte Carlo Approximation of

- · 이때, C(0\*) 이용해 얻은 Var(+rue ATE)를 D(0\*) 라 하자. ⇒ 값하나로 건정 # of Obs를 100, 1000 으로 하여 얻은 ÂTE 와 D(0\*) 이용해 신뢰구간 생성 --- Coverage Probability 계산 ①
- $: \# of obs 100, 1000 & Replication 1000번통해 <math>\widehat{ATE}_{RR}$  라  $\widehat{C}(\widehat{\theta})$  얻기 (즉,  $\theta^* \to \widehat{\theta}$  로  $E[\cdot] \to ' 뉴 졻 '$  로 변경해 계산 )
  - $\rightarrow \hat{c}(\hat{o})$  이용해  $\hat{Var}(\hat{A}_{EDR}) = \hat{D}(\hat{o})$  얻은 다음, Coverage probability 계산 -2
- · Package 이용해 얻은 Sandwich variance 추정량 이용해 Coverage probability 계산 -③

```
(Result)
① coverage probability [ #of obs > 100일 때: "0.925 " #of obs > 1000일 때: "0.956"
   --- D(0*) 이용해 얻은 Coverage probability는 Ok!
② Coverage Probability 「# of obs 가 100일 때: "0.276" Not Way...
3 Coverage Probability: # of Obs7+ 1000 & III " 0.955"
```
